

Name:

Geburtsdatum:

U2

Dear Parents,

The purpose of the U2 checkup is to detect congenital disorders. Although gross disorders are generally detected directly after birth during the U1 checkup, other problems only become apparent after a few days.

In order to prevent internal bleeding, it is recommended that your child again be given 2 drops of Vitamin K during the U2 checkup. This is harmless. Additionally, preventive treatment for rickets should be begun with Vitamin D.

Please answer the following questions and circle the corresponding answer.
